# <u>LDO Voltage Regulator</u> - Adjustable CMOS

# 1 A

# Description

The CAT6241 is a low dropout CMOS voltage regulator providing up to 1000 mA of output current with fast response to load current and line voltage changes. CAT6241 offers a user adjustable output voltage from 0.5 V to 5.0 V and its low quiescent current make CAT6241 ideal for energy conscious designs. CAT6241 is available in space saving 2 mm x 2 mm UDFN-8 and 3 mm x 3 mm WDFN-6 packages, each with a power pad for heat sinking to the PCB.

## **Features**

- Guaranteed 1000 mA Continuous Output Current
- V<sub>OUT</sub>: 0.5 V to 5.0 V, Minimum V<sub>IN</sub>: 1.6 V
- Dropout Voltage of 350 mV Typical at 1000 mA
- ±2.0% Output Voltage Accuracy at Room Temperature
- No-load Ground Current of 70 µA Typical
- Full-load Ground Current of 140 μA Typical
- "Zero" Current Shutdown Mode
- Under Voltage Lockout
- Stable with Ceramic Output Capacitors
- Current Limit and Thermal Protection
- 2 mm x 2 mm UDFN-8 and 3 mm x 3 mm WDFN-6 Packages
- These Devices are Pb–Free, Halogen Free/BFR Free and are RoHS Compliant

# **Typical Applications**

- DSP Core and I/O Voltages
- FPGAs, ASICs
- PDAs, Mobile Phones, GPS
- Camcorders and Cameras
- Hard Disk Drives

#### ORDERING INFORMATION

See detailed ordering and shipping information in the package dimensions section on page 17 of this data sheet.

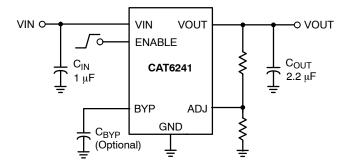

Figure 1. Application Schematic

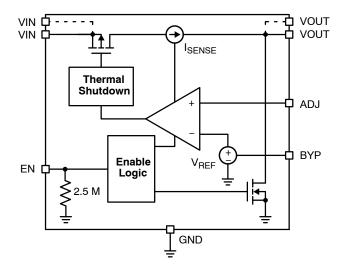

Figure 2. Simplified Block Diagram

**Table 1. PIN FUNCTION DESCRIPTION** 

Pin # WDFN-6	Pin # UDFN-8	Pin Name	Description
1	4	EN	The Enable Input. An active HIGH input, turning ON the LDO. This input should be tied to $V_{IN}$ if the LDO is not intended to be shut off during normal operation. A pull–down 2.5 M $\Omega$ resistor maintains the circuit in the OFF state if the pin is left open.
2, PAD	3, PAD	GND	Power Supply Ground; Device Substrate. The center pad is internally connected to Ground and as such can cause short circuits to signal traces running beneath the IC. This pad is intended for heat sinking the IC to the PCB and is typically connected to the PCB ground plane.
3	5	ВҮР	Bypass input. Placing a capacitor of 100 pF to 470 pF between BYP and ground reduces noise on $V_{OUT}$ . This capacitor is optional.
4	7, 8	V <sub>OUT</sub>	Regulated Output Voltage. A protection block eliminates any current flow from output to input if $V_{OUT} > V_{IN}$ . Connect both pins for specified dropout performance.
5	6	ADJ	Output Voltage Adjust Input. This input ties to the common point of a resistor divider which determines the regulator's output voltage. See Applications section for details on selecting resistor values.
6	1, 2	V <sub>IN</sub>	Positive Power Supply Input. Supplies power for V <sub>OUT</sub> as well as the regulator's internal circuitry. Connect both pins for specified dropout performance.

**Table 2. ABSOLUTE MAXIMUM RATINGS** 

Rating	Symbol	Value	Unit
Input Voltage Range (Note 1)	V <sub>IN</sub>	-0.3 to 6.0	V
Output Voltage Range	V <sub>OUT</sub>	-0.3 to 6.0	V
Enable Input Range	EN	-0.3 to 5.5 V or (V <sub>IN</sub> + 0.3), whichever is lower	V
Adjust Input Range	ADJ	-0.3 to 5.5 V	V
Bypass Input Range	BYP	-0.3 to 5.5 V or (V <sub>IN</sub> + 0.3), whichever is lower	٧
Power Dissipation	PD	Internally Limited	mW
Maximum Junction Temperature	T <sub>J(max)</sub>	150	°C
Storage Temperature Range	T <sub>STG</sub>	-65 to 150	°C
ESD Capability, Human Body Model (Note 2)	ESD <sub>HBM</sub>	2	kV
ESD Capability, Machine Model (Note 2)	ESD <sub>MM</sub>	200	V
Lead Temperature Soldering Reflow (SMD Styles Only), Pb-Free Versions (Note 3)	T <sub>SLD</sub>	260	°C

Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

- 1. Refer to ELECTRICAL CHARACTERISTIS and APPLICATION INFORMATION for Safe Operating range.
- 2. This device series incorporates ESD protection and is tested by the following methods:
  - ESD Human Body Model tested per AEC-Q100-002 (EIA/JESD22-A114)
  - ESD Machine Model tested per AEC-Q100-003 (EIA/JESD22-A115)
  - Latchup Current Maximum Rating: ≤150 mA per JEDEC standard: JÉSD78
- 3. For information, please refer to our Soldering and Mounting Techniques Reference Manual, SOLDERRM/D

$T_{SD}$	Thermal Shutdown			145		°C

Performance guaranteed over the indicated operating temperature range by design and/or characterization tested at T<sub>J</sub> = T<sub>A</sub> = 25°C. Low duty cycle pulse techniques are used during testing to maintain the junction temperature as close to ambient as possible.
 Output current capability depends upon the value of both V<sub>IN</sub> and V<sub>OUT</sub>. For V<sub>OUT</sub> ≤ 0.8 V, output current capability is 90% of ISC (see Figure 13). For V<sub>OUT</sub> > 0.8 V, current capability is 1 A for V<sub>IN</sub> ≥ 1.8 V.

#### **PIN FUNCTIONS**

#### $V_{IN}$

Positive Power Input. Power is supplied to the device through the  $V_{IN}$  pin. A bypass capacitor is required on this pin if the device is more than six inches away from the main input filter capacitor. In general it is advisable to include a small bypass capacitor adjacent to the regulator. In battery–powered circuits this is particularly important because the output impedance of a battery rises with frequency, so a bypass capacitor in the range of  $1~\mu F$  to  $10~\mu F$  is recommended.

#### **GND**

Ground. The negative voltage of the input power source. The center pad on the back of the package is also electrically ground. This pad is used for cooling the device by making connection to the buried ground plane through solder filled vias or by contact with a topside copper surface exposed to free flowing air.

#### **ENABLE**

ENABLE is an active high logic input which controls the regulator's the output state. If ENABLE < 0.4~V the regulator is shutdown and  $V_{OUT} = 0~V$ . If ENABLE > 1.6~V the regulator is active and supplying power to the load.

If the regulator is intended to operate continuously and won't be shut down from time to time ENABLE should be tied to  $V_{\rm IN}$ .

#### BYP

The Bypass Capacitor input is used to decrease output voltage noise by placing a capacitor between BYP and ground. The recommended range of capacitance is from 100 pF to 470 pF. Values larger than this will provide no additional improvement and will further extend CAT6241's startup time.

A bypass capacitor is not required for operation and BYP may be left open or floating if no capacitor is used but DO NOT ground BYP as this will interfere with the error amplifier's functioning.

# **ADJ**

ADJ = Adjust and is the voltage control input. ADJ connects to the center point of a resistor divider which determines the CAT6241's output voltage. See Applications Section for resistor selection guidelines.

#### Vout

 $V_{OUT}$  is the regulator's output and supplies power to the load.  $V_{OUT}$  can be shut off via the ENABLE input. All CAT6241 members are designed to block reverse current, meaning anytime  $V_{OUT}$  becomes greater than  $V_{IN}$  the pass FET will be shut off so there is no reverse current flow from output to input. CAT6241 is also equipped with an output discharge transistor that is turned ON anytime ENABLE is at a logic Low. This transistor ensures  $V_{OUT}$  discharges to 0 V when the regulator is shutdown. This is especially important when powering digital circuitry because if  $V_{OUT}$  fails to reach 0 V their POR (power–ON reset) circuitry may not trigger and scrambled data or unpredictable operations may result.

A minimum output capacitor of 2.2  $\mu F$  should be placed between  $V_{OUT}$  and GND to insure stable operation. Increasing the size of  $C_{OUT}$ , up to 22  $\mu F$ , will improve transient response to large changes in load current.

#### **APPLICATIONS INFORMATION**

# Input Decoupling (CIN)

A ceramic or tantalum 1  $\mu F$  capacitor is recommended and should be connected close to the CAT6241's package. Higher capacitance and lower ESR will improve the overall line and load transient response.

# Output Decoupling (COUT)

The minimum output decoupling value is  $2.2~\mu F$  and can be augmented to fulfill stringent load transient requirements. Larger values, up to  $22~\mu F$ , improve noise rejection and load regulation transient response. The CAT6241 is a highly stable regulator and performs well over a wide range of Equivalent Series Resistances (ESR) with ceramic chip capacitors.

# No-Load Regulation Considerations

The CAT6241 adjustable regulator will operate properly under conditions where the only load current is through the resistor divider that sets the output voltage. However, in the case where the CAT6241 is configured to provide a 0.5 V output, there is no resistor divider and the ADJ pin is connected to VOUT. If the part is enabled under no-load conditions, leakage current through the pass transistor at junction temperatures above 85°C can approach several microamperes, especially as junction temperature approaches 150°C. If this leakage current is not directed into a load, the output voltage will rise above nominal until a load is applied. For this reason it is recommended that a minimum load of 100 µA be present at all times. Normally the voltage setting resistor divider will serve this function but if no divider is used (VOUT = 0.5 V) then an external load of 5 K $\Omega$  should be provided.

#### **Output Voltage Adjust**

The output voltage can be adjusted from 0.5 V to 5.0 V using resistors between the output and the ADJ input. The output voltage and resistors are chosen using Equation 1 and Equation 2.

$$V_{OUT} = 0.5 \left( 1 + \frac{R_1}{R_2} \right) + \left( I_{ADJ} \times R_1 \right)$$
 (eq. 1)

$$R_2 \cong \frac{0.5 \text{ V}}{I_{DIV}} \tag{eq. 2}$$

$$R_1 \cong R_2 \left( \frac{V_{OUT}}{0.5 \text{ V}} - 1 \right) \tag{eq. 3}$$

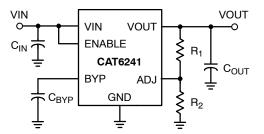

Figure 37. Adjustable Output Resistor Divider

Input bias current,  $I_{ADJ}$ , for all practical designs can be ignored ( $I_{ADJ}=0$ ). Considering that the lowest recommended  $I_{OUT}$  value is  $100~\mu A$ , then, when there is no load on  $V_{OUT}$ ,  $I_{divider}$  must be  $100~\mu A$  to keep CAT6241 in regulation. This then sets R2's value using Equation 2 to  $5~K\Omega$ , which minimizes output noise. Use Equation 3 to find the required value for R1. If needed, lower values for IDIV can be considered, but not lower than  $10~\mu A$ . The trade–off will be worse values for both load regulation and TCOUT.

#### **Thermal Considerations**

As power in the CAT6241 increases, it may become necessary to provide thermal relief. The maximum power dissipation supported by this device is dependent upon board design and layout. Mounting pad configuration on the PCB, the board material, and the ambient temperature affect the rate of junction temperature rise for the part. When the CAT6241 has good thermal conductivity through the PCB, the junction temperature will be relatively low even with high power applications. The maximum dissipation the CAT6241 can handle is given by:

$$P_{D(MAX)} = \frac{\left[T_{J(MAX)} - T_{A}\right]}{R_{AJA}}$$
 (eq. 4)

Since  $T_J$  is not recommended to exceed 125°C, then with CAT6241 soldered to 645 mm²(1 sq inch), 1 oz copper area, FR4 PCB material can dissipate in excess of 1 W when the ambient temperature ( $T_A$ ) is 25°C. Note that this assumes the pad in the center of the package is soldered to the dissipating copper foil. See Figure below for  $R_{\theta JA}$  versus PCB area for heat dissipating areas smaller than 645 mm². Power dissipation can be calculated from the following equations:

$$P_D \approx V_{IN}(I_{GND} + I_{OUT}) + I_{OUT}(V_{IN} - V_{OUT})$$
 (eq. 5)

OI

$$V_{IN(MAX)} \approx \frac{P_{D(MAX)} + (V_{OUT} \times I_{OUT})}{I_{OUT} + I_{GND}}$$
 (eq. 6)

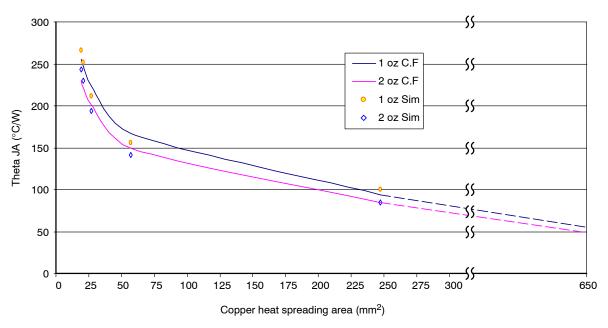

Figure 38. Thermal Resistance vs. PCB Copper Area for 3 mm x 3 mm WDFN Package

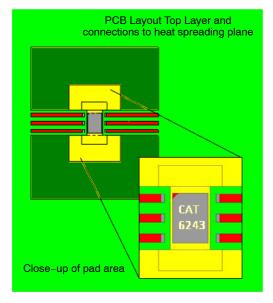

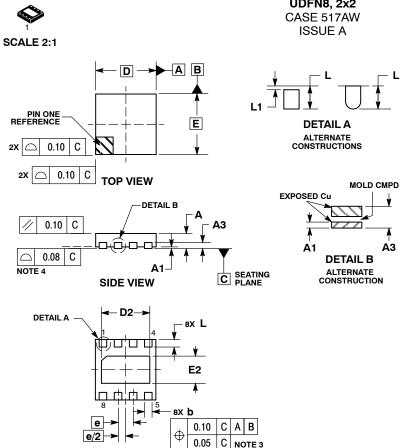

Figure 39. Topside Copper Foil Pattern for Heat Dissipation

# **Design Hints**

 $V_{\rm IN}$  and GND printed circuit board traces should be as wide as possible. When the impedance of these traces is high due to narrow trace width or long length, there is a chance to pick up noise or cause the regulator to malfunction. Place

external components, especially the input and output capacitors, as close as possible to the CAT6241, and keep traces between power source and load as short as possible.
